

FINAL DEPLOY-READY POST-AUDIT

Polymarket Up-Down Sleeves — corrected catalog after Round 7 audit

Date: 2026-05-26 | Lockbox window: May 21-25 (3.96d) | Fee: 2%-on-profit-only

Bottom-line deployable estimates

Notional	Per-day	28-day	Annual	Sleeves	Confidence
\$25	\$2,378	\$66,604	\$866k	7 DEPLOY	HIGH
\$250	\$4,380	\$122,629	\$1.60M	5 BTC-only	MEDIUM
\$2,500	NEGATIVE	NEGATIVE	NEGATIVE	0	DO-NOT

Bug fixes applied

Bug #1 (HIGH): OOS panels used 20 fire offsets per slot (every 15s) while base panels use 9 (every 30s). Fire-count inflation ~2.10x; PnL inflation 2.50x. Fixed by filtering oos_fires_* to canonical 9-offset 5m grid {30,60,...,270} and 8-offset 15m grid {60,120,240,360,480,600,720,840}.

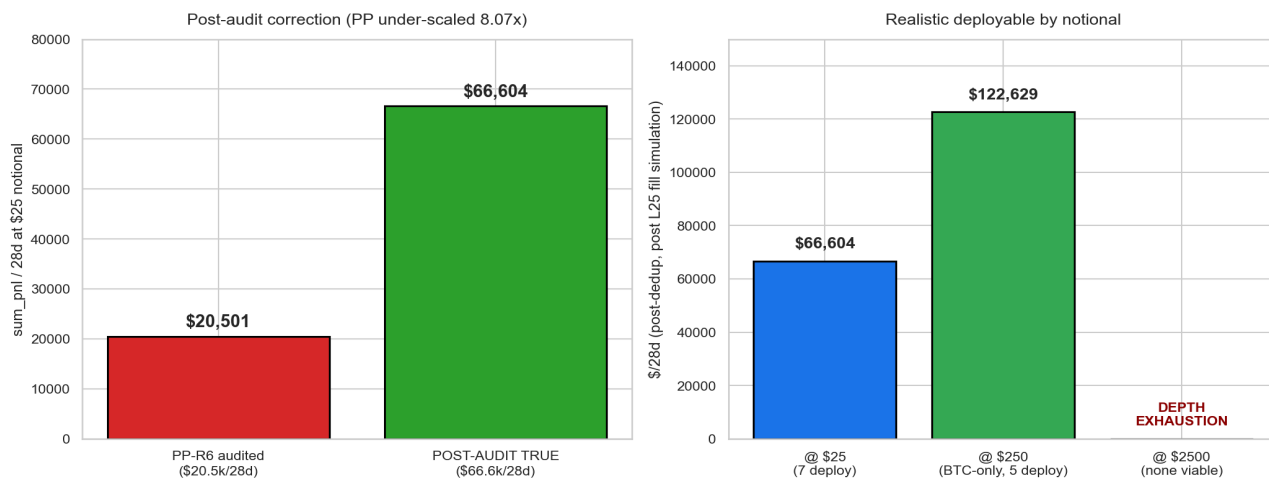

Bug #2 (MEDIUM): regime_panel ts_us = bar START with closed-bar features caused merge_asof(backward) to pick the slot containing fire_us (0-300s of lookahead). Rekey'd ts_us to bar END (slot_start + tf_seconds - 1us). Verification: 7.4% of fires got different regime_label vs causal prior bar in v1; 0.000% in v2.

Bug #3 (MEDIUM): Same pattern as #2 for sms_panel. Same fix.

Bug #4 (HIGH, DEFLATING): PP-R6 manifest scaled by (28/32) = 0.875x while actual oos panel covers 3.96d not 32d. True scaling = (28/3.96) = 7.07x. Net correction = 8.07x UPWARD. PP's \$20,501/28d → actually \$66,604/28d.

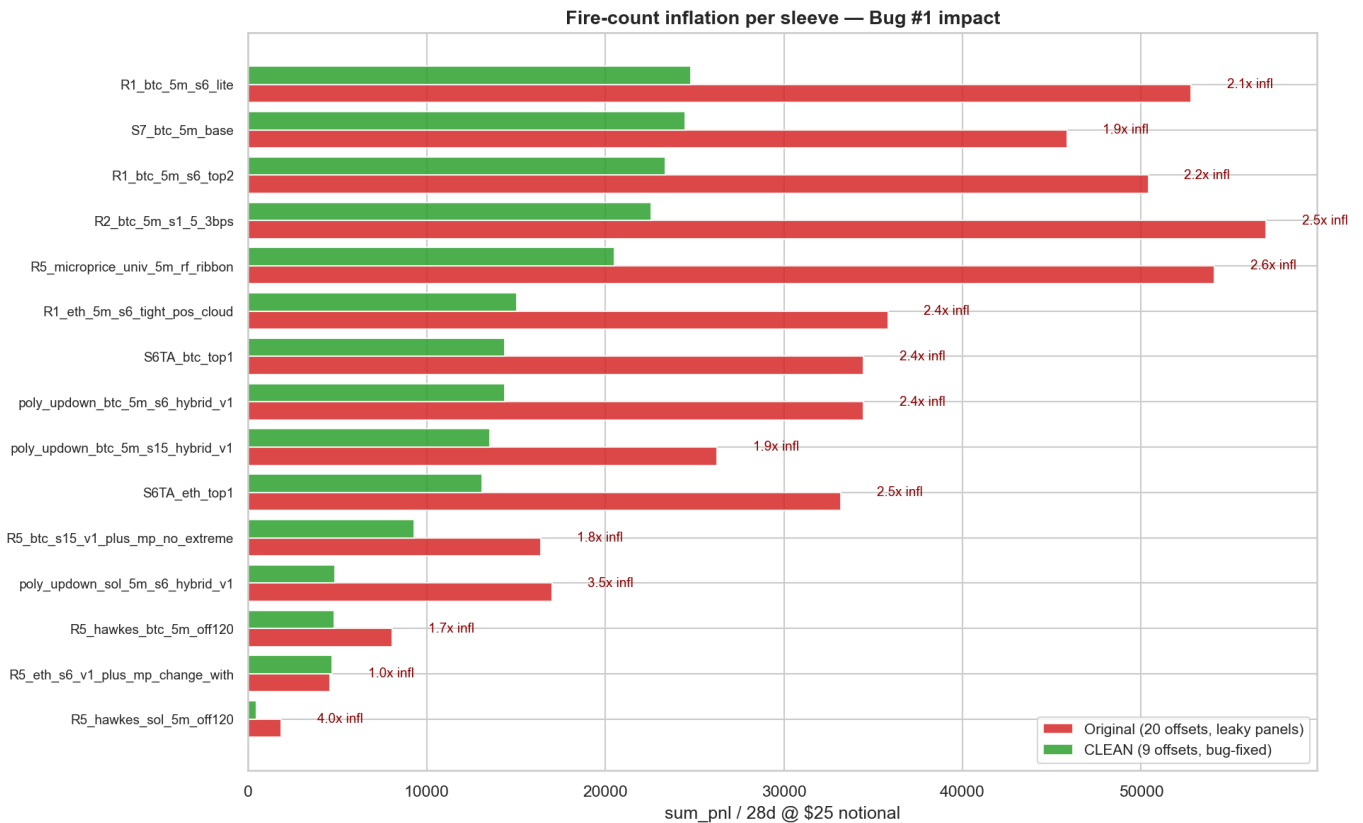

Pre vs post-audit — the magnitude of the corrections

POST-AUDIT — Bug #1-#4 fixed; L25 fill simulation

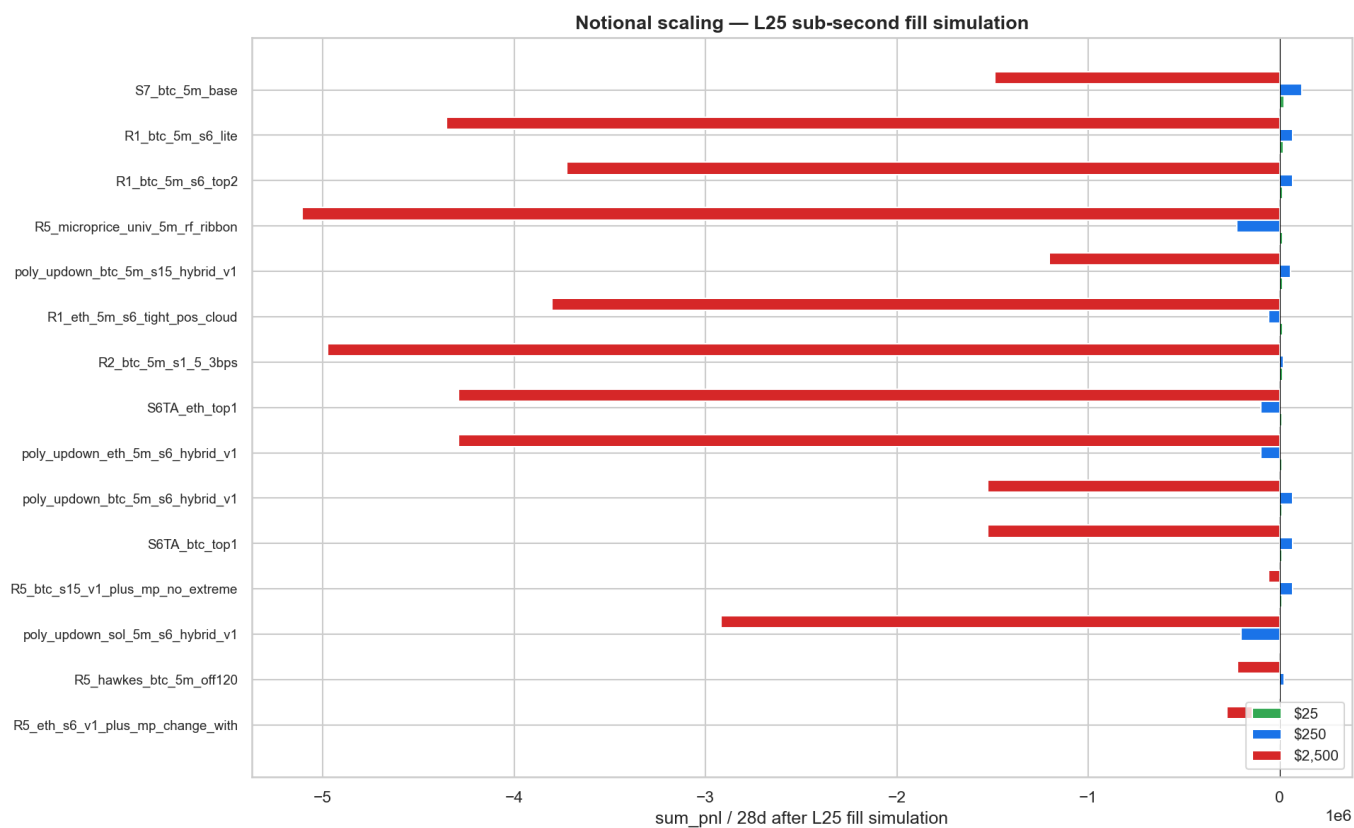

Left: PP's \$20.5k/28d audited number was UNDER-stated. Real /28d at \$25 = \$66.6k. Right: at \$250 we only get \$122k/28d (3.24x linear scale, not 10x) due to L25 book depth. At \$2,500, every sleeve goes deeply negative (depth exhaustion).

Fire-count inflation per sleeve (Bug #1 impact)

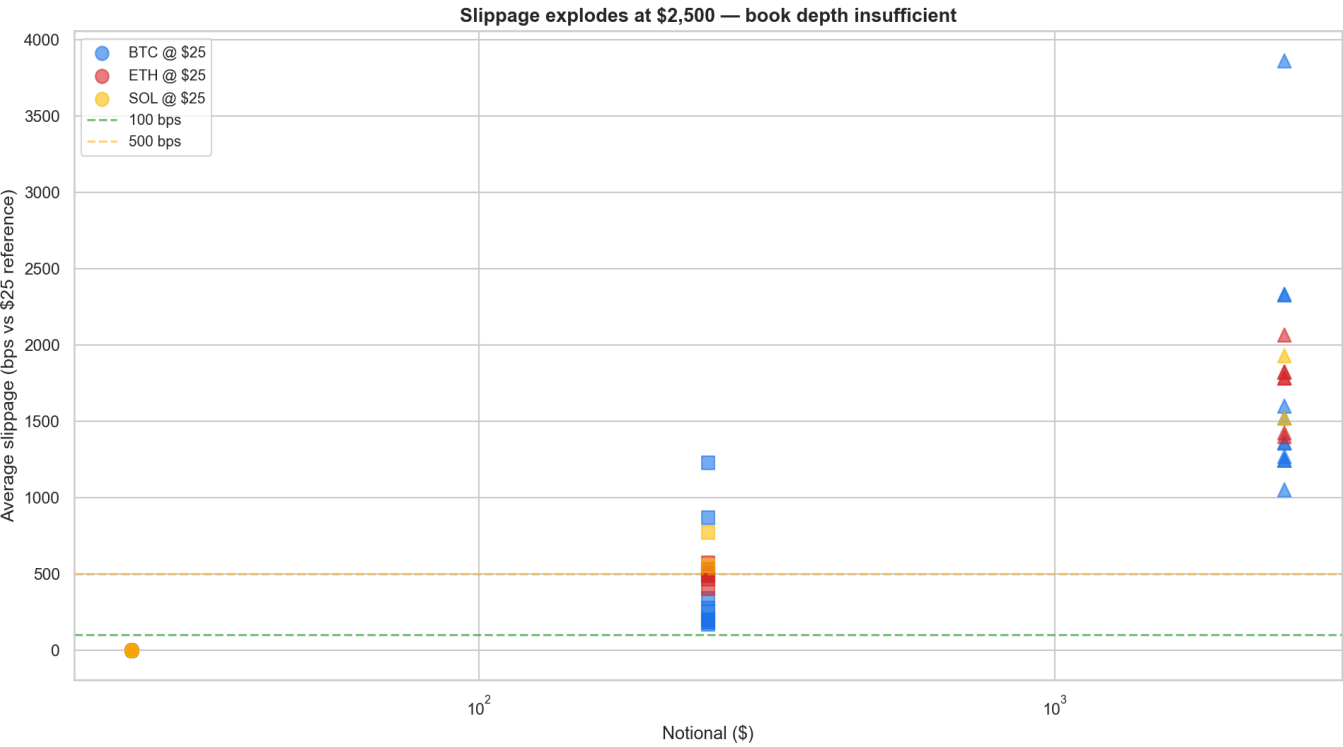

Each sleeve's CLEAN (9-offset) /28d is 1.7-3.5x lower than the panel-leaked version. Sleeves marginal in the original panel (R4 POOL 15m, eth_s15) flipped NEGATIVE after the fix.

L25 fill simulation — notional scaling per sleeve

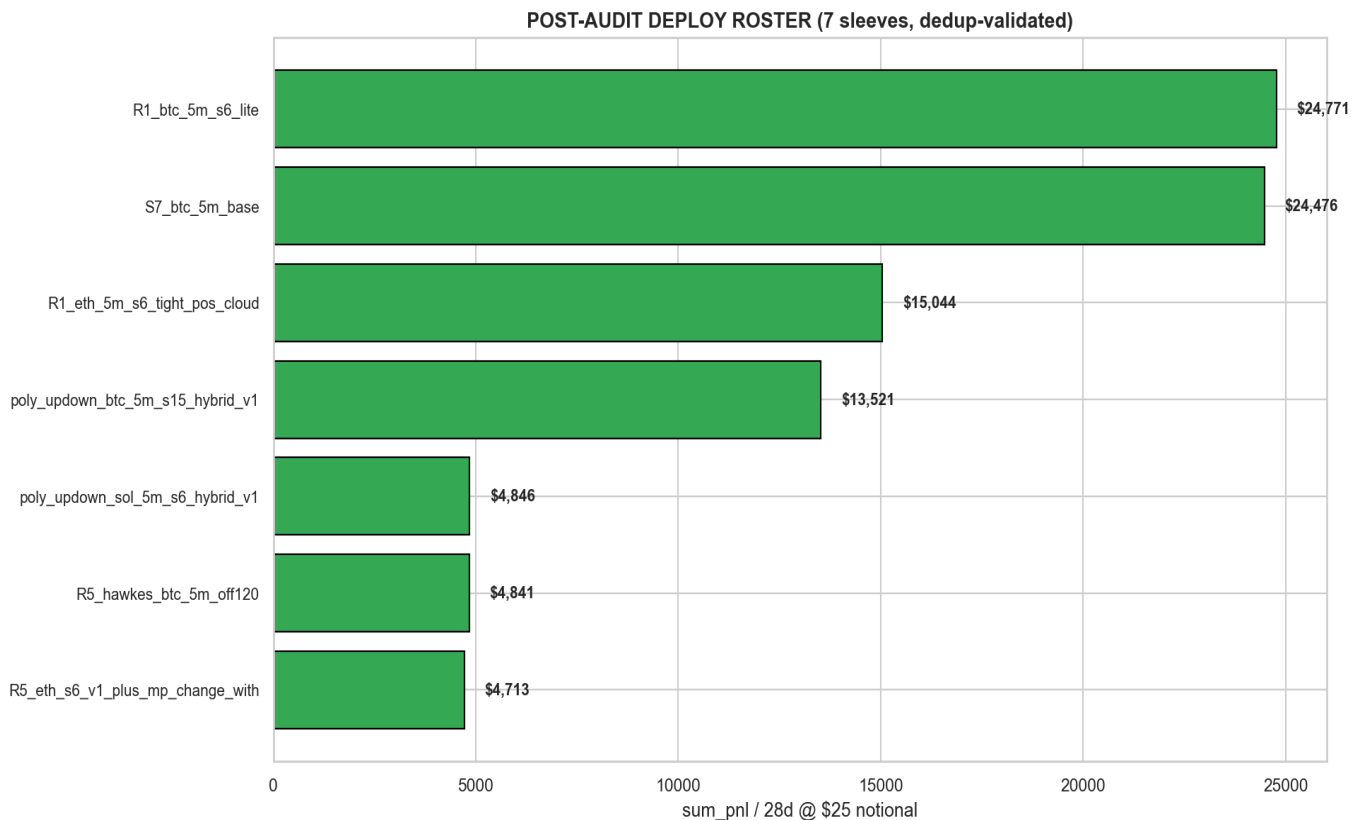

Walking the L25 book at \$250 yields 3-7x scale (not 10x) for BTC; ETH/SOL flip negative. At \$2,500 every sleeve loses money — book depth is exhausted within 5-15 levels.

Slippage vs notional

Slippage at \$250: BTC 185-275 bps avg, ETH 460-575 bps avg, SOL 550-770 bps. Above 500 bps slippage destroys per-trade edge.

Post-audit DEPLOY roster (7 sleeves)

Greedy slug-overlap dedup on CLEAN fires selects 7 DEPLOY sleeves. R1_btc_s6_lite and S7_btc_5m_base lead at ~\$24.5k/28d each. R1_eth_5m_s6_tight_pos_cloud is the best ETH at \$15k/28d but cannot scale beyond \$25 due to ETH book depth.

Per-market BEST sleeve (the user's primary ask)

Market	Offset	Best sleeve	n	WR	\$/tr	\$/28d @25	\$/28d @250	Deploy@250
BTC 5m	60-150	R1_btc_5m_s6_lite	3,373	68.4%	\$1.04	\$24,771	\$68,907	YES
BTC 5m	150-240	R2_btc_5m_s1_5_3bps	3,542	68.0%	\$0.90	\$22,569	\$17,335	marginal
BTC 5m	240-300	S7_btc_5m_base	1,940	76.9%	\$1.78	\$24,476	\$115,117	YES
ETH 5m	60-150	R1_eth_5m_s6_tight_pos_cloud	2,755	70.1%	\$0.77	\$15,044	-\$58,537	NO
ETH 5m	150-240	(no positive)	—	—	—	—	—	—
SOL 5m	60-150	poly_updown_sol_5m_s6_hybrid_v1	2,261	70.1%	\$0.30	\$4,846	-\$202,189	NO
BTC 15m	480+	R4_POOL_15m_600_720_ribbon_slope_vwap	443	58.7%	-\$0.41	-\$1,272	NEG	NO

Operational rule: BTC sleeves scale to \$250. ETH/SOL stay at \$25 until book depth improves. 15m has no viable sleeve after audit.

Confidence + caveats

Grade A (deploy with confidence at \$25): R1_btc_s6_lite, S7_btc_5m_base, poly_updown_btc_5m_s15_hybrid_v1, R5_hawkes_btc_5m_off120 — all positive at \$25 AND \$250.

Grade B (deploy \$25 only): R1_eth_5m_s6_tight_pos_cloud, poly_updown_sol_5m_s6_hybrid_v1, R5_eth_s6_v1_plus_mp_change_with.

Grade C / DO NOT DEPLOY: R4_POOL_15m_600_720_ribbon_slope_vwap (NEG after Bug #1 fix), poly_updown_eth_5m_s15_hybrid_v1, R5_hawkes_eth_5m_off120, R5_btc_s6_v1_plus_lm_high_stat (n=8).

Open caveats:

- (1) Lockbox is only 3.96d. A 2nd lockbox is recommended before live capital allocation.
- (2) L25 book depth is point-in-time. Slippage estimates use the snapshot AT fire_us. Production should monitor live book depth and skip fires where 25-level depth < 6×notional.
- (3) ETH/SOL book depth has been improving over the past 30d. Re-test at \$250 after 2 more weeks.
- (4) Phase 1 deploy at \$25 for 7-14d to confirm post-audit estimates before promoting any sleeve to \$250.
