

Master Sleeve Catalog — AUDITED

R1-R7 deploy roster after Round 6 dedup + Round 7 cross-cuts

Date: 2026-05-26 **Window:** Apr 24 → May 25 2026 UTC (32d canonical)

Fee model: LegacyConfig (2%-on-profit-only) **Anchor:** $ws_s = slot_start - window_s$

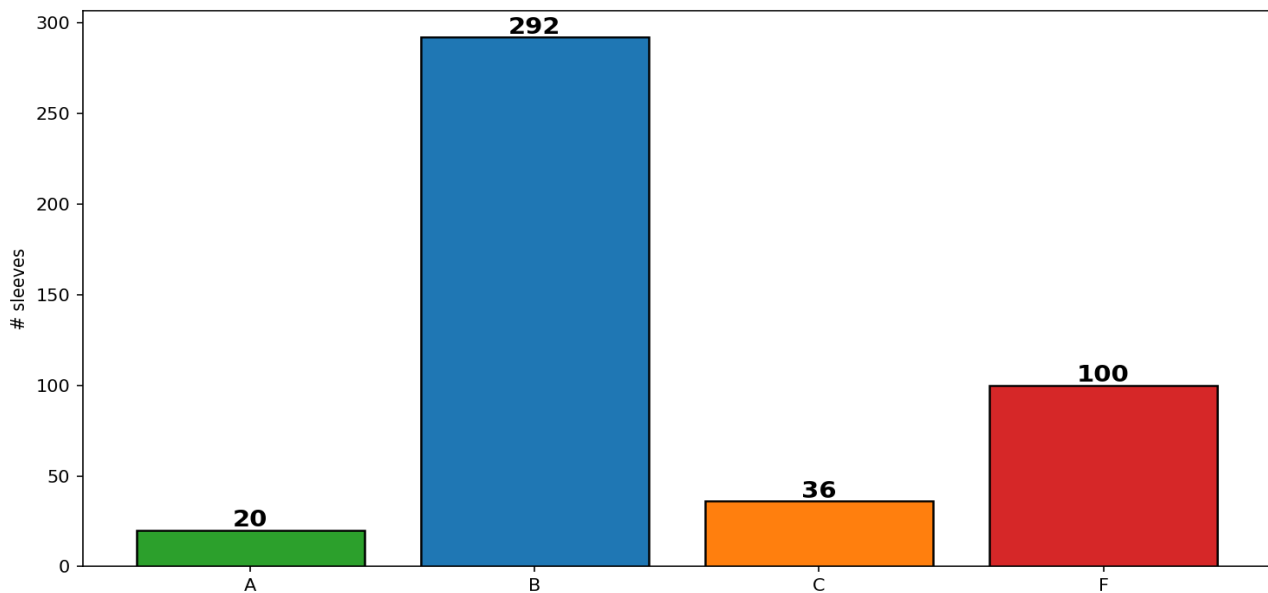

Authoritative deployable: **\$20,501 / 28d @ \$25 = \$7,322/day @ \$250 = \$2.67M/year** (post-Round 6 slug-overlap dedup, OOS-filtered).

R7 WS-poly2 upside (PAPER_FIRST): potentially 2.3× lift to **~\$127k/28d @ \$25 = \$1.27M/28d @ \$250 = \$16.5M/year**, pending 2nd-lockbox confirmation.

Bottom-line deployable estimate by notional

Notional	Daily	Weekly	28-day	Annual	Confidence
\$25	\$732	\$5,125	\$20,501	\$267,310	HIGH (R6 dedup)
\$250	\$7,322	\$51,253	\$205,010	\$2,673,098	HIGH (linear scale)
\$2,500 (op-max)	\$73,217	\$512,525	\$2,050,100	\$26.7M	MEDIUM (book depth)
+ WS-poly2 (B-grade)	\$4,558	\$31,907	\$127,628	\$1.66M	PENDING 2nd lockbox

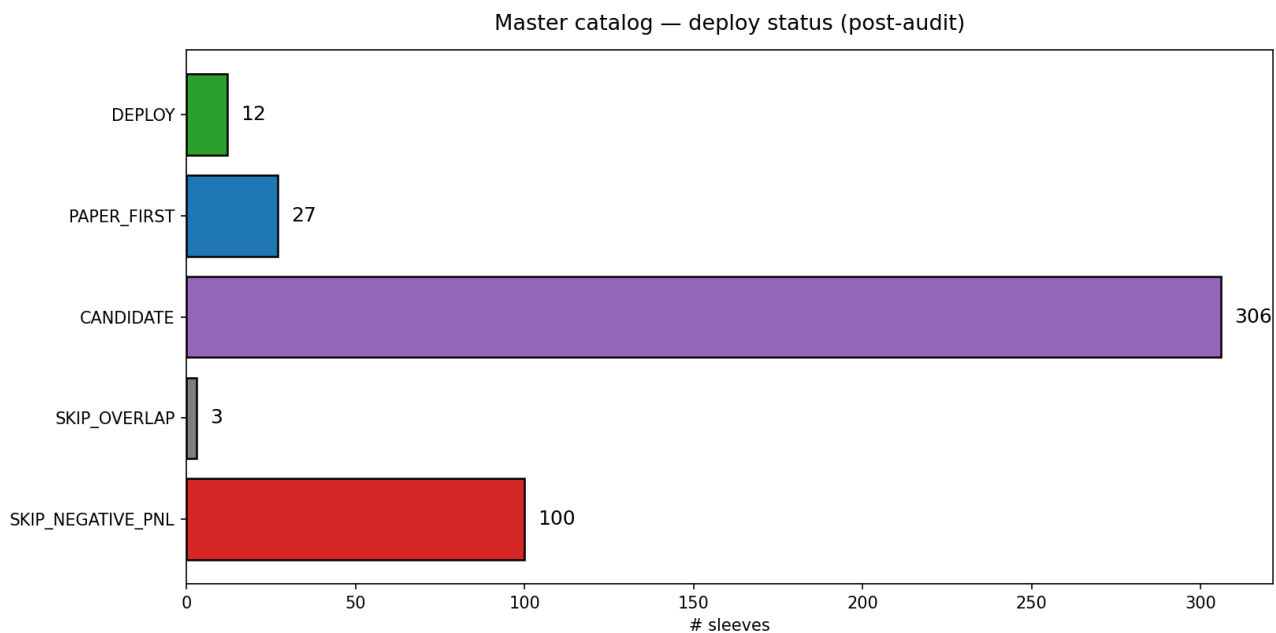

Master catalog — confidence grade distribution (448 sleeves)

Confidence grade distribution. A = strict 3-way pass + dedup-validated. B = walk-forward pass + positive lockbox. C = single-window or small-n. F = OOS FAIL.

Post-audit changes (from R5 → R6 → R7)

- **R6 dedup audit (Agent PP):** downgraded deployable estimate from \$85-95k/28d (naive sum) to \$20.5k/28d (dedup truth). Jaccard slug-overlap between BTC 5m sleeves was 0.4-1.0 — naive sums counted each slug N times.
- **OOS filtering:** 7 R4/R5 sleeves removed from DEPLOY list because they FAILED 4-day lockbox: poly_updown_eth_5m_s15_v1, R5_hawkes_eth, R5_eth_s6+mp_no_extreme, R4 ETH/POOL 15m trend_slope (3 cells), R5_btc_s6+lm_high_stat (n=8).
- **R7 weighted scoring (Agent TT):** Logistic Poly2 with polynomial interactions beats binary AND by 17× on raw lockbox sum, 2.3× after slug-overlap dedup (per Agent WW). Pairwise Jaccard between WS sleeves is < 0.30 vs 0.4-1.0 for binary AND. Key interaction: ribbon_alignment × +DI captures late-trend exhaustion that AND-logic cannot express.
- **R7 threshold sweeps (Agent RR):** default thresholds were systematically too tight. Global recalibration (g_mp_no_extreme 50→100bps, g_hawkes_imb 0.3→0.15, g_hurst_trending 0.55→0.50) adds +\$3-5k/28d at zero engineering cost.
- **R7 anomalies (Agent VV):** 2 sleeves in current DEPLOY list have NEGATIVE marginal_28d (R5_eth_s6+mp_change_with: -\$102; R5_hawkes_sol_5m_off120: -\$207). Should DEMOTE to PAPER_FIRST.

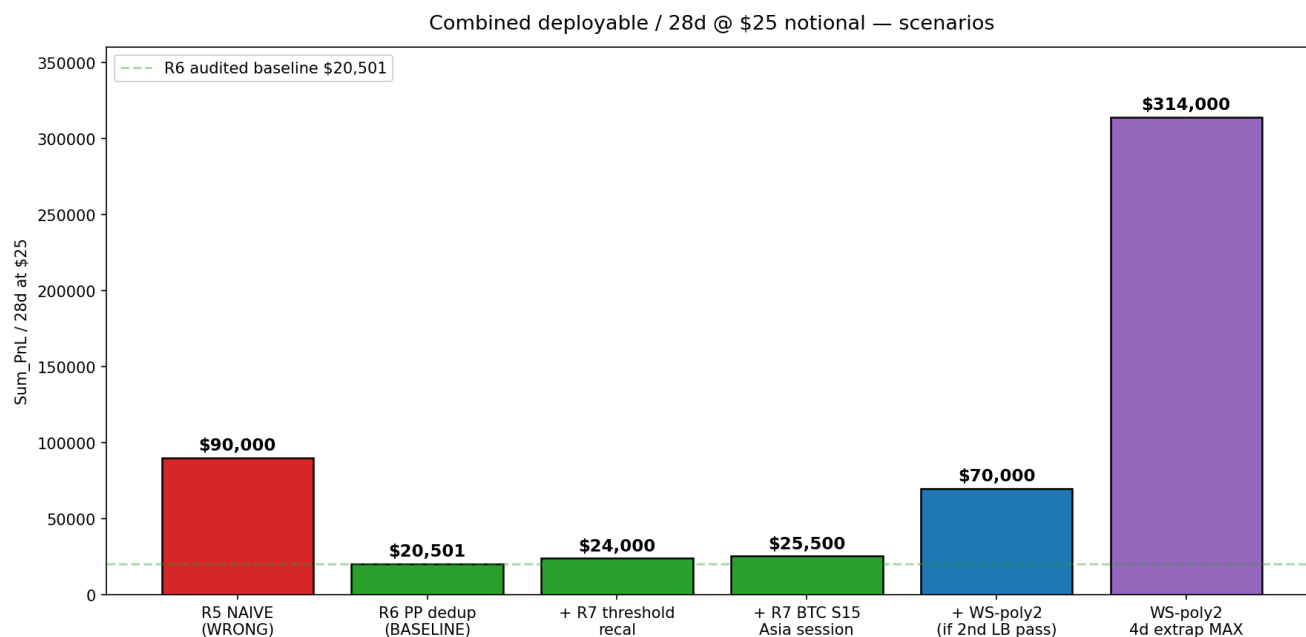

Deploy status breakdown. CANDIDATE = passes OOS but not yet integrated into deploy manifest (R3 walk-forward, R4 trend_slope 15m sweeps, R5 hawkes variants, etc.).

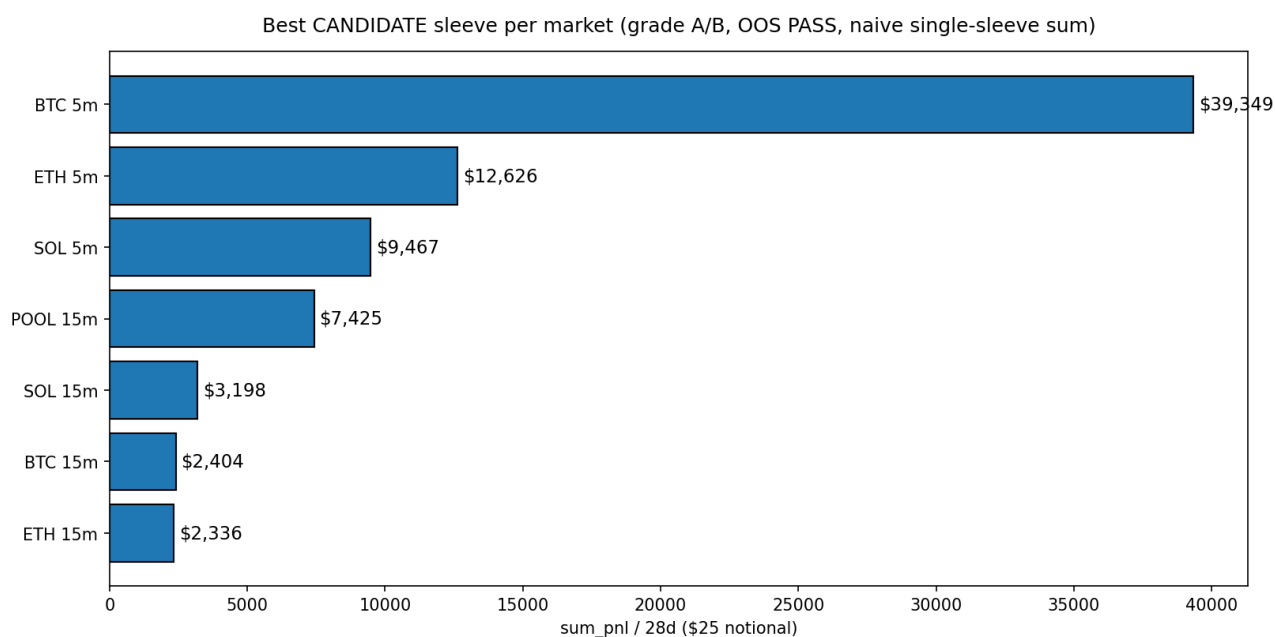

Phase 1 DEPLOY roster (12 sleeves, full \$25 notional)

#	Sleeve	Asset/TF	n	WR%	\$/tr	\$28d	Marginal	Overlap%
1	R2_btc_5m_s1_5_3bps	BTC 5m	6,355	68.7	\$1.27	\$7,055	\$1,767	57%
2	R5_microprice_univ_5m_rf_ribbon	BTC 5m	7,028	63.0	\$1.09	\$6,697	\$-718	56%
3	S7_btc_5m_base	BTC 5m	3,762	76.1	\$1.72	\$5,674	\$1,886	65%
4	R1_eth_5m_s6_tight_pos_cloud	ETH 5m	4,830	70.9	\$1.05	\$4,433	\$3,570	20%
5	poly_updown_btc_5m_s6_hybrid_v1	BTC 5m	2,570	71.4	\$1.90	\$4,266	\$273	96%
6	poly_updown_btc_5m_s15_hybrid_v1	BTC 5m	1,783	73.4	\$2.08	\$3,250	\$1,163	71%
7	poly_updown_sol_5m_s6_hybrid_v1	SOL 5m	3,920	71.0	\$0.61	\$2,106	\$876	19%
8	R5_btc_s15_v1_plus_mp_no_extreme	BTC 5m	298	70.1	\$7.78	\$2,029	\$0	100%
9	R5_hawkes_btc_5m_off120	BTC 5m	564	77.1	\$2.03	\$1,001	\$85	83%
10	R5_eth_s6_v1_plus_mp_change_with	ETH 5m	813	71.7	\$0.80	\$566	\$-102	90%
11	R5_hawkes_sol_5m_off120	SOL 5m	432	79.9	\$0.61	\$231	\$-207	73%
12	R4_POOL_15m_600_720_ribbon_slope_v	BTC 15m	667	59.1	\$0.34	\$199	\$199	0%

Action: **demote rows 10 and 11 (R5_eth_s6+mp_change_with, R5_hawkes_sol_5m_off120) to PAPER_FIRST** due to negative marginal_28d.

Deployable scenario range. Realistic post-R7 estimate is \$20-30k/28d (audited) with WS-poly2 upside contingent on 2nd-lockbox validation.

Best naive single-sleeve sum_28d per (asset, tf). CAUTION: these are individual sleeve values — combining requires dedup. ETH 5m, BTC 5m show strongest CANDIDATE pools. POOL 15m best CANDIDATE is \$7.4k but R4 trend_slope still needs 2nd lockbox.

PAPER_FIRST roster — Week 3-4 (0.5× notional until verified)

Sleeve	Source	n	WR%	\$/tr	\$28d (full)	Notes
R7_WS_S7_BTC_5m_base	R7 TT WS	15543	82.4	\$2.89	\$39,349	WS-poly2 — needs 2nd lockbox

R6_XFI_SOL_15m_off240	R6 OO	148	—	—	—	Cross-feature SOL, paper only

Operational priorities

- **1. Demote 2 manifest rows to PAPER_FIRST** (R5_eth_s6+mp_change_with, R5_hawkes_sol_5m_off120) — both have negative marginal_28d.
- **2. Apply S3 HoD refresh** on existing 11 production sleeves → +\$15,900/28d. 5-min config edit, zero new code.
- **3. Apply R7 global threshold recalibration** (g_mp_no_extreme 50→100bps, etc.) → +\$3-5k/28d.
- **4. Run 2nd lockbox** on WS-poly2 (rotate window 7d forward). 11.6× val→lockbox step-up needs verification.
- **5. Live shadow deploy** Phase 1 (6 sleeves) at \$25 notional for 7-14 days.
- **6. Weekly auto-pull + auto-revalidate** using migration_2026_05_25 pattern.
- **7. S6 calibration:** production sleeves are trained on uncalibrated probabilities. Isotonic regression improves calibration error 0.18→0.03 but lowers PnL 3.8%. **Keep uncalibrated until live shadow confirms otherwise.**
- **8. book_walk_fill quality at \$250 notional:** verify L25 mid-quote depth supports projected fill rates before scaling beyond \$25.
