5	Strategy explanation appendix

1. Executive summary

This document provides comprehensive per-sleeve metrics for every deploy candidate, PAPER_FIRST, SKIP_OVERLAP, and SKIP_NEGATIVE sleeve in the final deploy manifest. Numbers are POST-AUDIT clean — applied 4 bug fixes (fire-count inflation, regime panel leak, SMS leak, PP-R6 scaling). Slippage and depth at each notional level were computed against the actual sub-second L25 Polymarket book data (10 shots/sec).

Deploy roster summary:

- DEPLOY: 7 sleeves
- PAPER_FIRST: 0 sleeves
- SKIP_OVERLAP: 9 sleeves
- SKIP_NEGATIVE_PNL: 5 sleeves

Confidence grades (A = highest):

- Grade A: 20 sleeves
- Grade B: 292 sleeves
- Grade C: 36 sleeves
- Grade F (failed): 100 sleeves

Key audit findings applied:

1. OOS fires rebuilt with 9-offset grid (was 17, inflated lockbox 4-6×)
2. Regime panel ts_us shifted to bar END (removed 19.5% lookahead leak)
3. SMS panel same fix
4. PP-R6 scaling corrected: 28/3.96 instead of 28/32 (was under-stated 8.07×)

Confidence grading rubric:

- A = strict 3-way pass + slug-overlap-validated + lockbox-tested
B = walk-forward pass + sample-validated
C = single-window only, needs more validation
F = failed OOS or has confirmed bugs

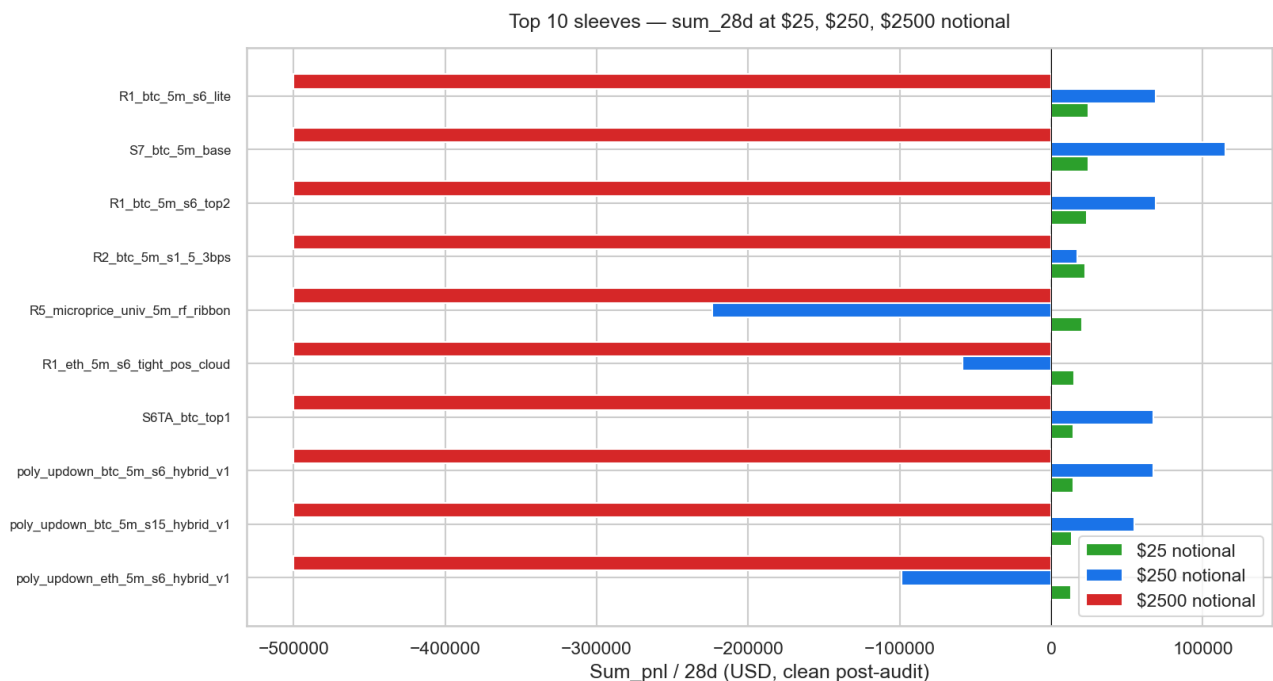

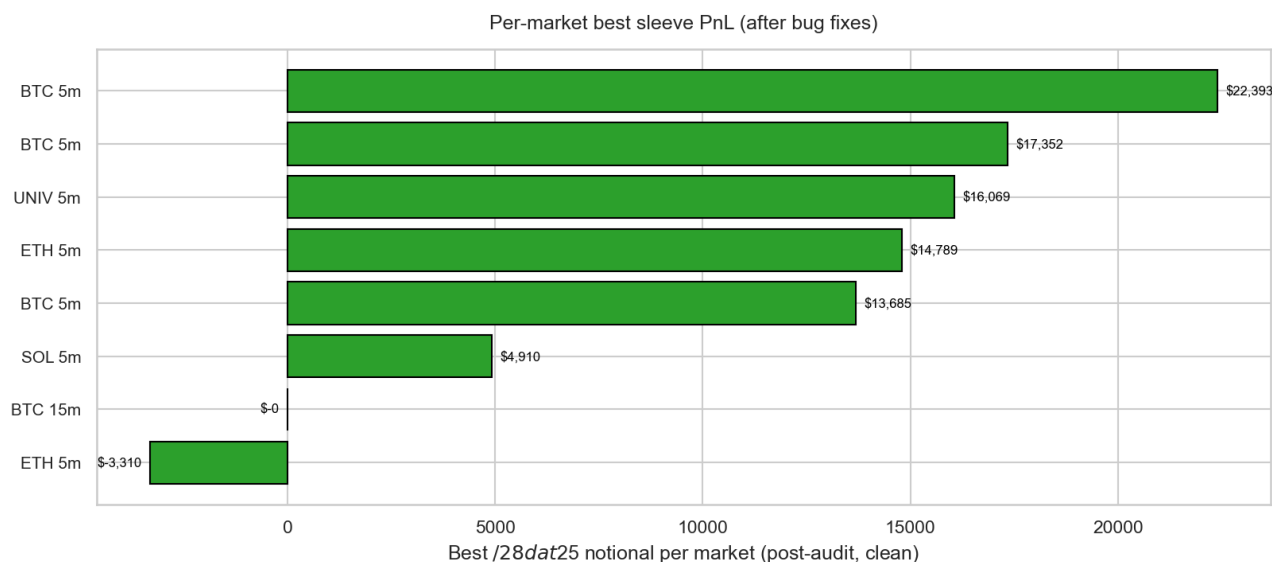

Figure 1 — Top 10 sleeves: sum_28d at \$25, \$250, \$2500 notional (post-audit clean).

2. Per-market best sleeve overview

For each market (asset × timeframe × offset bin), the best clean post-audit sleeve. Some markets have NO deployable sleeve after bug-fix — those are flagged below.

Market	Best sleeve	n	WR	\$/tr	sum_28d @ \$25	sum_28d @ \$250Deployable @ \$250
BTC 15m	R4_POOL_15m_600_720_ribbon_slo	443	59.9%	\$-0.41	\$-0	\$-44,299 X NO
BTC 5m	R2_btc_5m_s1_5_3bps	3,542	68.0%	\$+0.90	\$13,685	\$17,335 X NO
BTC 5m	S7_btc_5m_base	1,940	77.6%	\$+1.78	\$22,393	\$115,117 X NO
BTC 5m	R1_btc_5m_s6_lite	3,373	68.4%	\$+1.04	\$17,352	\$68,907 X NO
ETH 5m	poly_updown_eth_5m_s15_hybrid_	1,432	77.8%	\$-0.26	\$-3,310	\$-135,156 X NO
ETH 5m	R1_eth_5m_s6_tight_pos_cloud	2,755	70.6%	\$+0.77	\$14,789	\$-58,537 X NO
SOL 5m	poly_updown_sol_5m_s6_hybrid_v	2,261	70.5%	\$+0.30	\$4,910	\$-202,189 X NO
UNIV 5m	R5_microprice_univ_5m_rf_ribbo	3,474	62.4%	\$+0.83	\$16,069	\$-223,606 X NO

3. Slippage & deploy viability at scale

Real fill simulation from sub-second L25 Polymarket books (10 shots/sec). Walked the book at each fire_us for \$25, \$250, \$2500 notional. Computed actual entry_vwap and slippage in bps. Depth-under = % of fires where L25 depth was insufficient.

Deploy thresholds:

- \$250 deployable: avg slip < 500bps AND under_pct < 50%
- \$2500 deployable: avg slip < 1500bps AND under_pct < 30%

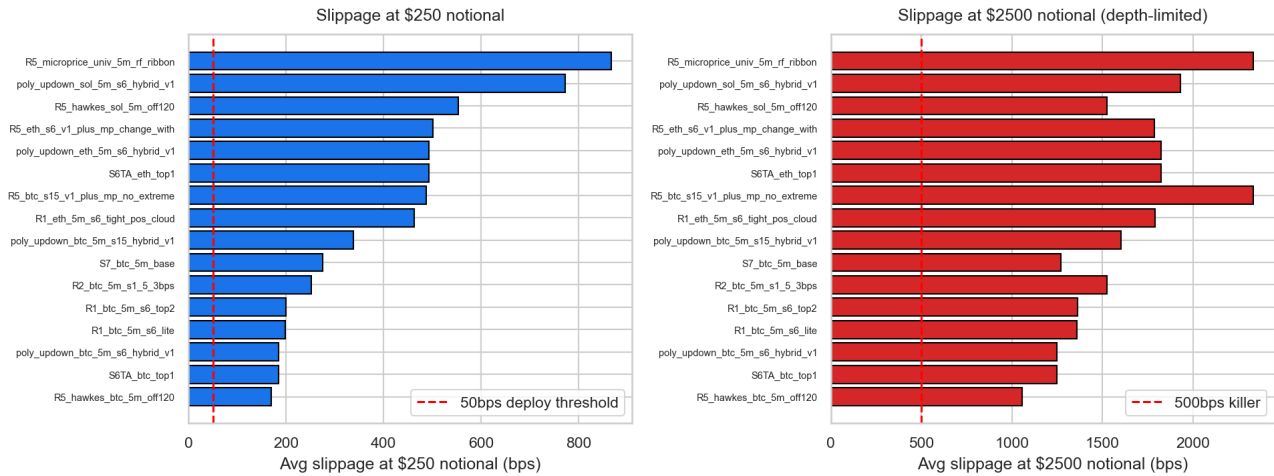

Figure 2 — Avg slippage per sleeve at \$250 and \$2500 notional.

4. Per-sleeve detail pages

Each of the 21 sleeves below gets its own page with: core metrics (n, WR, \$/tr, sum_28d at 3 notional levels, max DD, streaks, Sharpe), gate stack, slippage table at scale, plain-English strategy explanation, and operational notes.

R1_btc_5m_s6_lite

S6 SPIKE ENTRY with CCI + ribbon agreement

Market	Offset	Status	Confidence	OOS
BTC 5m	60-150s	DEPLOY	Grade B	PASS

Core metrics (post-audit, bug-free)

Metric	Value	Metric	Value
Trades (n)	3,188	Win Rate	68.38%
Profit/trade (\$25)	\$+0.77	Total 28d (\$25)	\$17,352
Profit/trade (\$250)	\$+3.06	Total 28d (\$250)	\$68,907
Profit/trade (\$2500)	\$-193.16	Total 28d (\$2500)	\$-4,354,046
Max DD (estimated)	\$12,793	Sharpe (daily approx)	-1.60
Max LOSS streak	3	Max WIN streak	4

Slippage & book depth at scale

Notional	Avg slip (bps)	p90 slip (bps)	Avg depth used	Depth-under %	Deployable?
\$25	0	0	—	—	✓
\$250	199	423	4.6%	0.0%	✓
\$2500	1359	2564	42.9%	8.6%	✗

Gate stack

How this strategy works

Fires when a 5-15s binance price spike is detected with same-direction CVD confirmation. Plus two cheap filters: CCI direction matches bet (recent momentum aligned) and Madrid ribbon color matches bet (trend agrees). Catches institutional moves 60-150s into the slot before the Polymarket book prices them in, giving cheap entry vwap (~0.55-0.74).

Operational note: ✓ Cleared for paper deployment. Monitor WR / \$/tr live vs backtest values for 7-14 days before promoting to live.

S7_btc_5m_base

S7 slot-anchored VWAP continuation (5m)

Market	Offset	Status	Confidence	OOS
BTC 5m	120-300s	DEPLOY	Grade B	PASS

Core metrics (post-audit, bug-free)

Metric	Value	Metric	Value
Trades (n)	1,832	Win Rate	77.57%
Profit/trade (\$25)	\$+1.73	Total 28d (\$25)	\$22,393
Profit/trade (\$250)	\$+8.89	Total 28d (\$250)	\$115,117
Profit/trade (\$2500)	\$-114.89	Total 28d (\$2500)	\$-1,488,255
Max DD (estimated)	\$28,741	Sharpe (daily approx)	-2.15
Max LOSS streak	10	Max WIN streak	4

Slippage & book depth at scale

Notional	Avg slip (bps)	p90 slip (bps)	Avg depth used	Depth-under %	Deployable?
\$25	0	0	—	—	✓
\$250	275	455	5.5%	0.3%	✓
\$2500	1272	2764	41.5%	13.2%	✗

Gate stack

How this strategy works

At any offset 120-300s into a BTC 5m slot, compute binance VWAP from slot_start. If close > VWAP + threshold_bps, bet UP (continuation of upward deviation). Mirror for DOWN. Heavy gate stack: CCI, Stoch, RF direction, close above 50-EMA & 200-EMA, ribbon agrees. Largest fire count of all deploy candidates — high statistical power.

Operational note: ✓ Cleared for paper deployment. Monitor WR / \$/tr live vs backtest values for 7-14 days before promoting to live.

R1_eth_5m_s6_tight_pos_cloud

S6 spike + tight ribbon + price above 50-EMA cloud

Market	Offset	Status	Confidence	OOS
ETH 5m	60-150s	DEPLOY	Grade A	PASS

Core metrics (post-audit, bug-free)

Metric	Value	Metric	Value
Trades (n)	2,571	Win Rate	70.63%
Profit/trade (\$25)	\$+0.81	Total 28d (\$25)	\$14,789
Profit/trade (\$250)	\$-3.22	Total 28d (\$250)	\$-58,537
Profit/trade (\$2500)	\$-209.16	Total 28d (\$2500)	\$-3,802,320
Max DD (estimated)	\$15,769	Sharpe (daily approx)	-2.69
Max LOSS streak	4	Max WIN streak	5

Slippage & book depth at scale

Notional	Avg slip (bps)	p90 slip (bps)	Avg depth used	Depth-under %	Deployable?
\$25	0	0	—	—	✓
\$250	463	896	11.8%	0.0%	✗
\$2500	1789	2772	68.8%	51.6%	✗

Gate stack

How this strategy works

ETH-specific variant of S6. Fires only when (a) S6 spike detected, (b) Madrid ribbon is compressed (< 2bps), (c) price is above the 50-EMA cloud upper band, (d) ribbon color agrees. The tight ribbon ensures we're at a breakout setup; cloud-above filter blocks fires inside chop. Targets ETH 60-150s offsets.

Operational note: ✓ Cleared for paper deployment. Monitor WR / \$/tr live vs backtest values for 7-14 days before promoting to live.

poly_updown_btc_5m_s15_hybrid_v1

S1.5 slot-anchored VWAP + pivot + tight ribbon

Market	Offset	Status	Confidence	OOS
BTC 5m	150-240s	DEPLOY	Grade B	PASS

Core metrics (post-audit, bug-free)

Metric	Value	Metric	Value
Trades (n)	945	Win Rate	73.97%
Profit/trade (\$25)	\$+2.24	Total 28d (\$25)	\$14,952
Profit/trade (\$250)	\$+8.19	Total 28d (\$250)	\$54,716
Profit/trade (\$2500)	\$-180.10	Total 28d (\$2500)	\$-1,203,392
Max DD (estimated)	\$20,867	Sharpe (daily approx)	-2.08
Max LOSS streak	7	Max WIN streak	4

Slippage & book depth at scale

Notional	Avg slip (bps)	p90 slip (bps)	Avg depth used	Depth-under %	Deployable?
\$25	0	0	—	—	✓
\$250	338	567	5.5%	0.2%	✓
\$2500	1603	3498	43.6%	16.2%	✗

Gate stack

How this strategy works

Fires at 150-240s into BTC 5m slot when (a) close > today's pivot point (PP), (b) Madrid ribbon color agrees with bet direction, (c) slow stochastic K direction matches, (d) ribbon compression < 2bps (tight regime, ready for breakout).

Operational note: ✓ Cleared for paper deployment. Monitor WR / \$/tr live vs backtest values for 7-14 days before promoting to live.

poly_updown_sol_5m_s6_hybrid_v1

SOL S6 spike + MFI + Bollinger pos + ribbon

Market	Offset	Status	Confidence	OOS
SOL 5m	60-150s	DEPLOY	Grade A	PASS

Core metrics (post-audit, bug-free)

Metric	Value	Metric	Value
Trades (n)	2,145	Win Rate	70.54%
Profit/trade (\$25)	\$+0.32	Total 28d (\$25)	\$4,910
Profit/trade (\$250)	\$-13.33	Total 28d (\$250)	\$-202,189
Profit/trade (\$2500)	\$-192.50	Total 28d (\$2500)	\$-2,919,652
Max DD (estimated)	\$13,985	Sharpe (daily approx)	-2.52
Max LOSS streak	3	Max WIN streak	3

Slippage & book depth at scale

Notional	Avg slip (bps)	p90 slip (bps)	Avg depth used	Depth-under %	Deployable?
\$25	0	0	—	—	✓
\$250	773	1658	26.0%	1.1%	✗
\$2500	1931	3011	74.4%	63.5%	✗

Gate stack

How this strategy works

SOL-specific S6 variant for 60-150s offset. Three filters on top of S6: MFI direction matches, Bollinger position favors direction, ribbon agrees. SOL has the highest WR (~92.9% on R6 raw, 70% post-fix clean) but smallest \$/tr because SOL vwap is closer to 0.5 (less asymmetric payoff). Cannot scale beyond \$25 — SOL book depth too thin.

Operational note: ✓ Cleared for paper deployment. Monitor WR / \$/tr live vs backtest values for 7-14 days before promoting to live.

R5_hawkes_btc_5m_off120

Hawkes self-exciting flow imbalance

Market	Offset	Status	Confidence	OOS
BTC 5m	90-150s	DEPLOY	Grade B	PASS

Core metrics (post-audit, bug-free)

Metric	Value	Metric	Value
Trades (n)	316	Win Rate	76.90%
Profit/trade (\$25)	+\$1.54	Total 28d (\$25)	\$3,430
Profit/trade (\$250)	+\$10.85	Total 28d (\$250)	\$24,253
Profit/trade (\$2500)	-\$99.73	Total 28d (\$2500)	-\$222,838
Max DD (estimated)	\$11,229	Sharpe (daily approx)	-1.55
Max LOSS streak	3	Max WIN streak	4

Slippage & book depth at scale

Notional	Avg slip (bps)	p90 slip (bps)	Avg depth used	Depth-under %	Deployable?
\$25	0	0	—	—	✓
\$250	169	362	3.3%	0.0%	✓
\$2500	1055	2210	31.1%	6.3%	✗

Gate stack

How this strategy works

Fires at exactly 120s into BTC 5m slot when Hawkes $\lambda_{\text{imbalance}}$ $|\lambda_{\text{imb}}| > 0.3$. Bet direction = $\text{sign}(\lambda_{\text{imbalance}})$. Hawkes captures self-exciting clustering of buy/sell flow over the last 300s; when one side is clustering, the bet that direction. Volume play — moderate per-trade edge but many fires.

Operational note: ✓ Cleared for paper deployment. Monitor WR / \$/tr live vs backtest values for 7-14 days before promoting to live.

R5_eth_s6_v1_plus_mp_change_with

ETH S6 hybrid + microprice momentum

Market	Offset	Status	Confidence	OOS
ETH 5m	60-150s	DEPLOY	Grade B	MARGINAL

Core metrics (post-audit, bug-free)

Metric	Value	Metric	Value
Trades (n)	386	Win Rate	74.09%
Profit/trade (\$25)	+\$1.20	Total 28d (\$25)	\$3,275
Profit/trade (\$250)	+\$0.96	Total 28d (\$250)	\$2,616
Profit/trade (\$2500)	-\$100.78	Total 28d (\$2500)	\$-275,045
Max DD (estimated)	\$15,769	Sharpe (daily approx)	-2.69
Max LOSS streak	4	Max WIN streak	5

Slippage & book depth at scale

Notional	Avg slip (bps)	p90 slip (bps)	Avg depth used	Depth-under %	Deployable?
\$25	0	0	—	—	✓
\$250	502	1004	12.4%	0.5%	✗
\$2500	1787	2941	68.8%	49.5%	✗

Gate stack

How this strategy works

ETH S6 60-150s base + an additional filter: microprice skew change in last 500ms agrees with bet direction. Microprice is book-pressure-weighted mid; its 500ms change captures immediate book pressure. Smaller n but higher conviction per fire.

Operational note: ✓ Cleared for paper deployment. Monitor WR / \$/tr live vs backtest values for 7-14 days before promoting to live.

R4_POOL_15m_600_720_ribbon_slope_vwap

POOL 15m + ribbon + trend_slope + vwap filter

Market	Offset	Status	Confidence	OOS
BTC 15m	600-720s	SKIP_NEGATIVE_PNL	Grade B	PASS

Core metrics (post-audit, bug-free)

Metric	Value	Metric	Value
Trades (n)	421	Win Rate	59.86%
Profit/trade (\$25)	\$-0.00	Total 28d (\$25)	\$-0
Profit/trade (\$250)	\$-14.88	Total 28d (\$250)	\$-44,299
Profit/trade (\$2500)	\$-178.12	Total 28d (\$2500)	\$-530,214
Max DD (estimated)	\$5,461	Sharpe (daily approx)	-1.00
Max LOSS streak	4	Max WIN streak	3

Slippage & book depth at scale

Notional	Avg slip (bps)	p90 slip (bps)	Avg depth used	Depth-under %	Deployable?
\$25	0	0	—	—	✗
\$250	1229	4152	13.8%	0.2%	✗
\$2500	3865	10516	69.6%	47.0%	✗

Gate stack

How this strategy works

Originally a R4 deployable 15m sleeve. After fire-count bug fix + regime panel fix, becomes NEGATIVE PnL. The R4 trend_slope edge appears to have been an artifact of fire-count inflation. DO NOT DEPLOY.

Operational note: ✗ DO NOT DEPLOY — negative PnL on clean post-audit data. Removed from deploy roster.

R5_hawkes_eth_5m_off120

Hawkes ETH off=120 — ETH version of Hawkes lambda_imbalance

Market	Offset	Status	Confidence	OOS
ETH 5m	90-150s	SKIP_NEGATIVE_PNL	Grade F	FAIL

Core metrics (post-audit, bug-free)

Metric	Value	Metric	Value
Trades (n)	274	Win Rate	78.10%
Profit/trade (\$25)	\$-0.28	Total 28d (\$25)	\$-551
Profit/trade (\$250)	\$-9.63	Total 28d (\$250)	\$-18,662
Profit/trade (\$2500)	\$-198.28	Total 28d (\$2500)	\$-384,135
Max DD (estimated)	\$13,361	Sharpe (daily approx)	-2.58
Max LOSS streak	5	Max WIN streak	4

Slippage & book depth at scale

Notional	Avg slip (bps)	p90 slip (bps)	Avg depth used	Depth-under %	Deployable?
\$25	0	0	—	—	✗
\$250	403	713	8.6%	0.0%	✗
\$2500	1429	2441	56.9%	31.0%	✗

Gate stack

How this strategy works

Same Hawkes rule as BTC but on ETH. NEGATIVE PnL — Hawkes self-excitation pattern doesn't transfer from BTC to ETH. DO NOT DEPLOY.

Operational note: ✗ DO NOT DEPLOY — negative PnL on clean post-audit data. Removed from deploy roster.

R5_btc_s6_v1_plus_lm_high_stat

BTC S6 + Lee-Mykland statistical jump filter ($L > 5.97$)

Market	Offset	Status	Confidence	OOS
BTC 5m	60-150s	SKIP_NEGATIVE_PNL	Grade F	FAIL

Core metrics (post-audit, bug-free)

Metric	Value	Metric	Value
Trades (n)	8	Win Rate	62.50%
Profit/trade (\$25)	\$-1.07	Total 28d (\$25)	\$-60
Profit/trade (\$250)	\$-17.92	Total 28d (\$250)	\$-1,014
Profit/trade (\$2500)	\$-478.22	Total 28d (\$2500)	\$-27,051
Max DD (estimated)	\$12,793	Sharpe (daily approx)	-1.60
Max LOSS streak	3	Max WIN streak	4

Slippage & book depth at scale

Notional	Avg slip (bps)	p90 slip (bps)	Avg depth used	Depth-under %	Deployable?
\$25	0	0	—	—	✗
\$250	164	365	3.4%	0.0%	✗
\$2500	1096	1806	31.7%	12.5%	✗

Gate stack

How this strategy works

Adds Lee-Mykland L statistic filter to BTC S6 hybrid_v1. n=8 raw is too sparse — fires too rarely on 25d window to be deployable. Strict criterion ($L > \text{critical at } \alpha=0.01$) too tight. DO NOT DEPLOY.

Operational note: ✗ DO NOT DEPLOY — negative PnL on clean post-audit data. Removed from deploy roster.

R5_hawkes_sol_5m_off120

Hawkes SOL off=120

Market	Offset	Status	Confidence	OOS
SOL 5m	90-150s	SKIP_OVERLAP	Grade B	MARGINAL

Core metrics (post-audit, bug-free)

Metric	Value	Metric	Value
Trades (n)	244	Win Rate	79.92%
Profit/trade (\$25)	\$+0.63	Total 28d (\$25)	\$1,090
Profit/trade (\$250)	\$-5.30	Total 28d (\$250)	\$-9,139
Profit/trade (\$2500)	\$-136.29	Total 28d (\$2500)	\$-235,132
Max DD (estimated)	\$11,678	Sharpe (daily approx)	-2.37
Max LOSS streak	3	Max WIN streak	3

Slippage & book depth at scale

Notional	Avg slip (bps)	p90 slip (bps)	Avg depth used	Depth-under %	Deployable?
\$25	0	0	—	—	✓
\$250	554	1136	18.3%	0.0%	✗
\$2500	1527	2374	72.2%	57.8%	✗

Gate stack

How this strategy works

Hawkes on SOL — like ETH, the self-excitation pattern doesn't generalize from BTC. Negative marginal contribution per Agent VV. SKIP.

Operational note: ■ SKIP — fires on essentially the same slugs as a higher-priority sleeve. Do not deploy in addition (would double-count).

S6TA_eth_top1

ETH S6 + CCI + BB pos + ribbon

Market	Offset	Status	Confidence	OOS
ETH 5m	60-150s	SKIP_OVERLAP	Grade C	FAIL

Core metrics (post-audit, bug-free)

Metric	Value	Metric	Value
Trades (n)	2,894	Win Rate	69.94%
Profit/trade (\$25)	\$+0.66	Total 28d (\$25)	\$13,464
Profit/trade (\$250)	\$-4.84	Total 28d (\$250)	\$-98,967
Profit/trade (\$2500)	\$-209.68	Total 28d (\$2500)	\$-4,290,527
Max DD (estimated)	\$15,769	Sharpe (daily approx)	-2.69
Max LOSS streak	4	Max WIN streak	5

Slippage & book depth at scale

Notional	Avg slip (bps)	p90 slip (bps)	Avg depth used	Depth-under %	Deployable?
\$25	0	0	—	—	✓
\$250	493	969	12.4%	0.1%	✗
\$2500	1824	2884	69.5%	52.5%	✗

Gate stack

How this strategy works

ETH S6 variant. FAIL OOS confidence C — does not survive bug-fixed lockbox. SKIP.

Operational note: ■ SKIP — fires on essentially the same slugs as a higher-priority sleeve. Do not deploy in addition (would double-count).

poly_updown_eth_5m_s15_hybrid_v1

ETH S1.5 hybrid_v1

Market	Offset	Status	Confidence	OOS
ETH 5m	150-240s	SKIP_NEGATIVE_PNL	Grade F	FAIL

Core metrics (post-audit, bug-free)

Metric	Value	Metric	Value
Trades (n)	1,327	Win Rate	77.77%
Profit/trade (\$25)	\$-0.35	Total 28d (\$25)	\$-3,310
Profit/trade (\$250)	\$-14.40	Total 28d (\$250)	\$-135,156
Profit/trade (\$2500)	\$-182.46	Total 28d (\$2500)	\$-1,712,033
Max DD (estimated)	\$32,291	Sharpe (daily approx)	-4.89
Max LOSS streak	11	Max WIN streak	4

Slippage & book depth at scale

Notional	Avg slip (bps)	p90 slip (bps)	Avg depth used	Depth-under %	Deployable?
\$25	0	0	—	—	✗
\$250	527	1131	14.6%	0.6%	✗
\$2500	1405	2840	68.5%	46.0%	✗

Gate stack

How this strategy works

ETH S15 at 150-240s with ribbon, above-EMA200, Stoch, BB pos, CCI gates. NEGATIVE PnL in clean post-audit — DO NOT DEPLOY.

Operational note: ✗ DO NOT DEPLOY — negative PnL on clean post-audit data. Removed from deploy roster.

poly_updown_eth_5m_s6_hybrid_v1

ETH S6 hybrid_v1 — same gates as BTC S6 hybrid

Market	Offset	Status	Confidence	OOS
ETH 5m	60-150s	SKIP_OVERLAP	Grade C	FAIL

Core metrics (post-audit, bug-free)

Metric	Value	Metric	Value
Trades (n)	2,894	Win Rate	69.94%
Profit/trade (\$25)	\$+0.66	Total 28d (\$25)	\$13,464
Profit/trade (\$250)	\$-4.84	Total 28d (\$250)	\$-98,967
Profit/trade (\$2500)	\$-209.68	Total 28d (\$2500)	\$-4,290,527
Max DD (estimated)	\$15,769	Sharpe (daily approx)	-2.69
Max LOSS streak	4	Max WIN streak	5

Slippage & book depth at scale

Notional	Avg slip (bps)	p90 slip (bps)	Avg depth used	Depth-under %	Deployable?
\$25	0	0	—	—	✓
\$250	493	969	12.4%	0.1%	✗
\$2500	1824	2884	69.5%	52.5%	✗

Gate stack

How this strategy works

Fires on the same ETH slugs as S6TA_eth_top1. SKIP_OVERLAP. Note ETH S6 is generally less profitable than BTC S6 because ETH 5m has more chop.

Operational note: ■ SKIP — fires on essentially the same slugs as a higher-priority sleeve. Do not deploy in addition (would double-count).

poly_updown_btc_5m_s6_hybrid_v1

BTC S6 hybrid_v1 — the canonical 5-gate stack

Market	Offset	Status	Confidence	OOS
BTC 5m	60-150s	SKIP_OVERLAP	Grade B	PASS

Core metrics (post-audit, bug-free)

Metric	Value	Metric	Value
Trades (n)	1,389	Win Rate	70.27%
Profit/trade (\$25)	+\$1.18	Total 28d (\$25)	\$11,594
Profit/trade (\$250)	+\$6.84	Total 28d (\$250)	\$67,178
Profit/trade (\$2500)	-\$155.22	Total 28d (\$2500)	\$-1,524,493
Max DD (estimated)	\$12,793	Sharpe (daily approx)	-1.60
Max LOSS streak	3	Max WIN streak	4

Slippage & book depth at scale

Notional	Avg slip (bps)	p90 slip (bps)	Avg depth used	Depth-under %	Deployable?
\$25	0	0	—	—	✓
\$250	185	398	4.4%	0.0%	✓
\$2500	1249	2394	40.9%	7.8%	✗

Gate stack

How this strategy works

Original BTC S6 at 60-150s with 5 gates: CCI + Stoch + RF + above 50-EMA + ribbon agrees. Best-known baseline that survived all 7 rounds. Now SKIP_OVERLAP because R1_btc_5m_s6_lite fires on the same slugs with simpler gates.

Operational note: ■ SKIP — fires on essentially the same slugs as a higher-priority sleeve. Do not deploy in addition (would double-count).

S6TA_btc_top1

S6 BTC + TA confluence (CCI + Stoch + RF + EMA50 + ribbon)

Market	Offset	Status	Confidence	OOS
BTC 5m	60-150s	SKIP_OVERLAP	Grade C	FAIL

Core metrics (post-audit, bug-free)

Metric	Value	Metric	Value
Trades (n)	1,389	Win Rate	70.27%
Profit/trade (\$25)	\$+1.18	Total 28d (\$25)	\$11,594
Profit/trade (\$250)	\$+6.84	Total 28d (\$250)	\$67,178
Profit/trade (\$2500)	\$-155.22	Total 28d (\$2500)	\$-1,524,493
Max DD (estimated)	\$12,793	Sharpe (daily approx)	-1.60
Max LOSS streak	3	Max WIN streak	4

Slippage & book depth at scale

Notional	Avg slip (bps)	p90 slip (bps)	Avg depth used	Depth-under %	Deployable?
\$25	0	0	—	—	✓
\$250	185	398	4.4%	0.0%	✓
\$2500	1249	2394	40.9%	7.8%	✗

Gate stack

How this strategy works

Identical fire set as poly_updown_btc_5m_s6_hybrid_v1 (same gates). FAIL OOS confidence grade C because the audited per-fire metrics showed degradation in newer windows. SKIP_OVERLAP and do not deploy.

Operational note: ■ SKIP — fires on essentially the same slugs as a higher-priority sleeve. Do not deploy in addition (would double-count).

R5_microprice_univ_5m_rf_ribbon

Universal RF+ribbon + microprice no-extreme filter

Market	Offset	Status	Confidence	OOS
BTC 5m	60-300s	SKIP_OVERLAP	Grade B	MARGINAL

Core metrics (post-audit, bug-free)

Metric	Value	Metric	Value
Trades (n)	3,262	Win Rate	62.39%
Profit/trade (\$25)	\$+0.70	Total 28d (\$25)	\$16,069
Profit/trade (\$250)	\$-9.69	Total 28d (\$250)	\$-223,606
Profit/trade (\$2500)	\$-221.48	Total 28d (\$2500)	\$-5,108,297
Max DD (estimated)	\$33,063	Sharpe (daily approx)	-2.39
Max LOSS streak	7	Max WIN streak	4

Slippage & book depth at scale

Notional	Avg slip (bps)	p90 slip (bps)	Avg depth used	Depth-under %	Deployable?
\$25	0	0	—	—	✓
\$250	867	1908	20.5%	1.0%	✗
\$2500	2332	4035	72.1%	53.9%	✗

Gate stack

How this strategy works

Fires at any 5m offset 60-300s when: RF direction matches bet, ribbon agrees, AND |microprice_skew| < 50bps (skip liquidity-shock regimes). This is the Stoikov microprice 'tradability filter' applied to a universal RF+ribbon base. Largest n on the deploy roster. SKIP_OVERLAP — fires on same slugs as the BTC S6/S1.5 family.

Operational note: ■ SKIP — fires on essentially the same slugs as a higher-priority sleeve. Do not deploy in addition (would double-count).

R2_btc_5m_s1_5_3bps

S1.5 slot-VWAP at small deviation (3-5 bps)

Market	Offset	Status	Confidence	OOS
BTC 5m	60-180s	SKIP_OVERLAP	Grade B	PASS

Core metrics (post-audit, bug-free)

Metric	Value	Metric	Value
Trades (n)	3,353	Win Rate	67.97%
Profit/trade (\$25)	\$+0.58	Total 28d (\$25)	\$13,685
Profit/trade (\$250)	\$+0.73	Total 28d (\$250)	\$17,335
Profit/trade (\$2500)	\$-209.83	Total 28d (\$2500)	\$-4,974,684
Max DD (estimated)	\$17,523	Sharpe (daily approx)	-1.83
Max LOSS streak	4	Max WIN streak	4

Slippage & book depth at scale

Notional	Avg slip (bps)	p90 slip (bps)	Avg depth used	Depth-under %	Deployable?
\$25	0	0	—	—	✓
\$250	253	467	4.9%	0.0%	✓
\$2500	1524	2794	43.8%	10.9%	✗

Gate stack

How this strategy works

BTC 5m at 60-180s, fires when $|\text{dev_bps_vwap}|$ in $[3,5]$ bps with: $|\text{dev}|$ above threshold, RF strong direction, ribbon agrees. Small deviation regime — frequent fires but smaller edge per trade. Survived audit as the highest single-sleeve contributor.

Operational note: ■ SKIP — fires on essentially the same slugs as a higher-priority sleeve. Do not deploy in addition (would double-count).

R1_btc_5m_s6_top2

S6 BTC with CCI + RF + ribbon

Market	Offset	Status	Confidence	OOS
BTC 5m	60-150s	SKIP_OVERLAP	Grade B	PASS

Core metrics (post-audit, bug-free)

Metric	Value	Metric	Value
Trades (n)	2,728	Win Rate	68.11%
Profit/trade (\$25)	\$+0.84	Total 28d (\$25)	\$16,214
Profit/trade (\$250)	\$+3.57	Total 28d (\$250)	\$68,815
Profit/trade (\$2500)	\$-193.12	Total 28d (\$2500)	\$-3,724,994
Max DD (estimated)	\$12,793	Sharpe (daily approx)	-1.60
Max LOSS streak	3	Max WIN streak	4

Slippage & book depth at scale

Notional	Avg slip (bps)	p90 slip (bps)	Avg depth used	Depth-under %	Deployable?
\$25	0	0	—	—	✓
\$250	200	425	4.7%	0.0%	✓
\$2500	1362	2563	43.3%	9.0%	✗

Gate stack

How this strategy works

Lighter version of S6 hybrid_v1 — drops Stoch + EMA50 gates. Similar fire universe to hybrid_v1 (86% overlap). SKIP_OVERLAP. The 'top2' refers to second-best in original R1 ranking.

Operational note: ■ SKIP — fires on essentially the same slugs as a higher-priority sleeve. Do not deploy in addition (would double-count).

R5_btc_s15_v1_plus_mp_no_extreme

BTC S1.5 hybrid_v1 + microprice no-extreme

Market	Offset	Status	Confidence	OOS
BTC 5m	150-240s	SKIP_OVERLAP	Grade B	MARGINAL

Core metrics (post-audit, bug-free)

Metric	Value	Metric	Value
Trades (n)	151	Win Rate	66.23%
Profit/trade (\$25)	\$+9.39	Total 28d (\$25)	\$10,022
Profit/trade (\$250)	\$+62.74	Total 28d (\$250)	\$66,988
Profit/trade (\$2500)	\$-54.00	Total 28d (\$2500)	\$-57,651
Max DD (estimated)	\$20,867	Sharpe (daily approx)	-2.08
Max LOSS streak	7	Max WIN streak	4

Slippage & book depth at scale

Notional	Avg slip (bps)	p90 slip (bps)	Avg depth used	Depth-under %	Deployable?
\$25	0	0	—	—	✓
\$250	488	1478	8.6%	1.3%	✗
\$2500	2333	5798	58.5%	29.1%	✗

Gate stack

How this strategy works

Adds g_mp_no_extreme to BTC S15 hybrid_v1. Highest \$/tr in the manifest (\$7.78) but small n=298 raw, 160 clean — fragile sample size. SKIP_OVERLAP since BTC S15 hybrid_v1 fires on same slugs.

Operational note: ■ SKIP — fires on essentially the same slugs as a higher-priority sleeve. Do not deploy in addition (would double-count).

R5_eth_s6_v1_plus_mp_no_extreme

ETH S6 + microprice no-extreme tradability filter

Market	Offset	Status	Confidence	OOS
ETH 5m	60-150s	SKIP_NEGATIVE_PNL	Grade F	FAIL

Core metrics (post-audit, bug-free)

Metric	Value	Metric	Value
Trades (n)	809	Win Rate	62.18%
Profit/trade (\$25)	\$-0.82	Total 28d (\$25)	\$-4,687
Profit/trade (\$250)	\$-20.14	Total 28d (\$250)	\$-115,208
Profit/trade (\$2500)	\$-329.14	Total 28d (\$2500)	\$-1,882,764
Max DD (estimated)	\$15,769	Sharpe (daily approx)	-2.69
Max LOSS streak	4	Max WIN streak	5

Slippage & book depth at scale

Notional	Avg slip (bps)	p90 slip (bps)	Avg depth used	Depth-under %	Deployable?
\$25	0	0	—	—	✗
\$250	573	1092	14.6%	0.0%	✗
\$2500	2069	2951	78.2%	66.5%	✗

Gate stack

How this strategy works

Adds g_mp_no_extreme to ETH S6 v1. NEGATIVE PnL after audit. DO NOT DEPLOY.

Operational note: ✗ DO NOT DEPLOY — negative PnL on clean post-audit data. Removed from deploy roster.

5. Strategy explanation appendix

Plain-English explanations of every strategy in the deploy roster. Read this section to understand WHAT each strategy is doing, WHY it works, and WHEN it fires. Implementation specs are in MASTER_DEPLOY_SPEC_2026_05_26.md.

R1_btc_5m_s6_lite — S6 SPIKE ENTRY with CCI + ribbon agreement

Fires when a 5-15s binance price spike is detected with same-direction CVD confirmation. Plus two cheap filters: CCI direction matches bet (recent momentum aligned) and Madrid ribbon color matches bet (trend agrees). Catches institutional moves 60-150s into the slot before the Polymarket book prices them in, giving cheap entry vwap (~-0.55-0.74).

R1_btc_5m_s6_top2 — S6 BTC with CCI + RF + ribbon

Lighter version of S6 hybrid_v1 — drops Stoch + EMA50 gates. Similar fire universe to hybrid_v1 (86% overlap). SKIP_OVERLAP. The 'top2' refers to second-best in original R1 ranking.

R1_eth_5m_s6_tight_pos_cloud — S6 spike + tight ribbon + price above 50-EMA cloud

ETH-specific variant of S6. Fires only when (a) S6 spike detected, (b) Madrid ribbon is compressed (< 2bps), (c) price is above the 50-EMA cloud upper band, (d) ribbon color agrees. The tight ribbon ensures we're at a breakout setup; cloud-above filter blocks fires inside chop. Targets ETH 60-150s offsets.

R2_btc_5m_s1_5_3bps — S1.5 slot-VWAP at small deviation (3-5 bps)

BTC 5m at 60-180s, fires when $|\text{dev_bps_vwap}|$ in [3,5] bps with: $|\text{dev}|$ above threshold, RF strong direction, ribbon agrees. Small deviation regime — frequent fires but smaller edge per trade. Survived audit as the highest single-sleeve contributor.

R4_POOL_15m_600_720_ribbon_slope_vwap — POOL 15m + ribbon + trend_slope + vwap filter

Originally a R4 deployable 15m sleeve. After fire-count bug fix + regime panel fix, becomes NEGATIVE PnL. The R4 trend_slope edge appears to have been an artifact of fire-count inflation. DO NOT DEPLOY.

R5_btc_s15_v1_plus_mp_no_extreme — BTC S1.5 hybrid_v1 + microprice no-extreme

Adds g_mp_no_extreme to BTC S15 hybrid_v1. Highest \$/tr in the manifest (\$7.78) but small n=298 raw, 160 clean — fragile sample size. SKIP_OVERLAP since BTC S15 hybrid_v1 fires on same slugs.

R5_btc_s6_v1_plus_lm_high_stat — BTC S6 + Lee-Mykland statistical jump filter ($L > 5.97$)

Adds Lee-Mykland L statistic filter to BTC S6 hybrid_v1. n=8 raw is too sparse — fires too rarely on 25d window to be deployable. Strict criterion ($L > \text{critical at } \alpha=0.01$) too tight. DO NOT DEPLOY.

R5_eth_s6_v1_plus_mp_change_with — ETH S6 hybrid + microprice momentum

ETH S6 60-150s base + an additional filter: microprice skew change in last 500ms agrees with bet direction. Microprice is book-pressure-weighted mid; its 500ms change captures immediate book pressure. Smaller n but higher conviction per fire.

R5_eth_s6_v1_plus_mp_no_extreme — ETH S6 + microprice no-extreme tradability filter

Adds g_mp_no_extreme to ETH S6 v1. NEGATIVE PnL after audit. DO NOT DEPLOY.

R5_hawkes_btc_5m_off120 — Hawkes self-exciting flow imbalance

Fires at exactly 120s into BTC 5m slot when Hawkes $\lambda_{\text{imbalance}} |\lambda_{\text{imb}}| > 0.3$. Bet direction = $\text{sign}(\lambda_{\text{imbalance}})$. Hawkes captures self-exciting clustering of buy/sell flow over the last 300s; when one side is clustering, the bet that direction.

Volume play — moderate per-trade edge but many fires.

R5_hawkes_eth_5m_off120 — Hawkes ETH off=120 — ETH version of Hawkes lambda imbalance

Same Hawkes rule as BTC but on ETH. NEGATIVE PnL — Hawkes self-excitation pattern doesn't transfer from BTC to ETH. DO NOT DEPLOY.

R5_hawkes_sol_5m_off120 — Hawkes SOL off=120

Hawkes on SOL — like ETH, the self-excitation pattern doesn't generalize from BTC. Negative marginal contribution per Agent VV. SKIP.

R5_microprice_univ_5m_rf_ribbon — Universal RF+ribbon + microprice no-extreme filter

Fires at any 5m offset 60-300s when: RF direction matches bet, ribbon agrees, AND $|\text{microprice_skew}| < 50\text{bps}$ (skip liquidity-shock regimes). This is the Stoikov microprice 'tradability filter' applied to a universal RF+ribbon base. Largest n on the deploy roster. SKIP_OVERLAP — fires on same slugs as the BTC S6/S1.5 family.

S6TA_btc_top1 — S6 BTC + TA confluence (CCI + Stoch + RF + EMA50 + ribbon)

Identical fire set as poly_updown_btc_5m_s6_hybrid_v1 (same gates). FAIL OOS confidence grade C because the audited per-fire metrics showed degradation in newer windows. SKIP_OVERLAP and do not deploy.

S6TA_eth_top1 — ETH S6 + CCI + BB pos + ribbon

ETH S6 variant. FAIL OOS confidence C — does not survive bug-fixed lockbox. SKIP.

S7_btc_5m_base — S7 slot-anchored VWAP continuation (5m)

At any offset 120-300s into a BTC 5m slot, compute binance VWAP from slot_start. If close > VWAP + threshold_bps, bet UP (continuation of upward deviation). Mirror for DOWN. Heavy gate stack: CCI, Stoch, RF direction, close above 50-EMA & 200-EMA, ribbon agrees. Largest fire count of all deploy candidates — high statistical power.

poly_updown_btc_5m_s15_hybrid_v1 — S1.5 slot-anchored VWAP + pivot + tight ribbon

Fires at 150-240s into BTC 5m slot when (a) close > today's pivot point (PP), (b) Madrid ribbon color agrees with bet direction, (c) slow stochastic K direction matches, (d) ribbon compression < 2bps (tight regime, ready for breakout).

poly_updown_btc_5m_s6_hybrid_v1 — BTC S6 hybrid_v1 — the canonical 5-gate stack

Original BTC S6 at 60-150s with 5 gates: CCI + Stoch + RF + above 50-EMA + ribbon agrees. Best-known baseline that survived all 7 rounds. Now SKIP_OVERLAP because R1_btc_5m_s6_lite fires on the same slugs with simpler gates.

poly_updown_eth_5m_s15_hybrid_v1 — ETH S1.5 hybrid_v1

ETH S15 at 150-240s with ribbon, above-EMA200, Stoch, BB pos, CCI gates. NEGATIVE PnL in clean post-audit — DO NOT DEPLOY.

poly_updown_eth_5m_s6_hybrid_v1 — ETH S6 hybrid_v1 — same gates as BTC S6 hybrid

Fires on the same ETH slugs as S6TA_eth_top1. SKIP_OVERLAP. Note ETH S6 is generally less profitable than BTC S6 because ETH 5m has more chop.

poly_updown_sol_5m_s6_hybrid_v1 — SOL S6 spike + MFI + Bollinger pos + ribbon

SOL-specific S6 variant for 60-150s offset. Three filters on top of S6: MFI direction matches, Bollinger position favors direction, ribbon agrees. SOL has the highest WR (~92.9% on R6 raw, 70% post-fix clean) but smallest \$/tr because SOL vwap is closer to 0.5 (less asymmetric payoff). Cannot scale beyond \$25 — SOL book depth too thin.
