Hyperliquid Deployment Checklist

Account setup

- Fund a Hyperliquid account with $10,000 USDC (USD-equivalent).
- Set account-wide leverage to 5x in Hyperliquid UI.
- Enable spot-margin (perp) for the 6 coins below.

Coin / strategy map

- BTCUSDT → V4C_range_kalman
- ETHUSDT → V3B_adx_gate
- SOLUSDT → V4C_range_kalman
- LINKUSDT → V3B_adx_gate
- ADAUSDT → V4C_range_kalman
- XRPUSDT → HWR1_bb_meanrev

Position sizing

- On every new entry: notional = 5.0% × current equity.
- With 5x leverage: margin used per position = 1.00% of equity.
- Max gross exposure if all 6 coins long simultaneously: 1.5x equity.
- Size is recomputed at entry time using CURRENT equity, not initial capital.

Execution rules — LIMIT ORDERS BOTH SIDES (backtest model)

- Timeframe: 4h bars. Signal generated on BAR CLOSE.
- On entry signal: post LIMIT BUY at the signal-bar close price; if the
- next bar's low <= that price it fills; otherwise cancel and re-post.
- On exit signal (regime flip): post LIMIT SELL at close; falls back to
- a market SL if not filled within 2 bars (taker fee applies there).
- Trailing stop (TSL) fires as a MARKET order when hit — accept the
- taker fee for those exits; they are in the minority.
- Fee assumption in backtest: 0.015% maker per side (Hyperliquid spot-
- equivalent perp maker). Slippage 0 bps on limit fills.

Risk guards

- Kill-switch: if portfolio equity drops > 35% from ATH, halt all new entries.
- Per-coin kill-switch: if one coin loses > 50% of its allocated max loss, pause it.
- Fat-finger guard: reject any order notional > 3x recommended sizing.
- Rebalance frequency: none — strategies are independent, position-level.

Forward-test before going live

- Run on Hyperliquid testnet (or the paper-mode adapter) for ≥ 2 weeks.
- Compare live trade log vs equivalent backtest bar-by-bar (tolerance ±1%).
- If OOS Sharpe drifts below 0.5 over a rolling 3-month window, halt.
